## PRODUCT INFORMATION

## GENERAL INFORMATION

Product Name:
Code No. :
Size : $\quad 15 \mu$ g (lyophilized plasmid contains salt of TE buffer)
Storage : This product is shipped at ambient temperature. Upon receipt, store at - $20{ }^{\circ} \mathrm{C}$
Reconstitution : Resuspend the lyophilized pETBK with $15 \mu 1$ of sterile water to make $1 \mu \mathrm{~g} / \mu \mathrm{l}$ plasmid in $1 \times \mathrm{TE}$ buffer. After reconstitution, store at $-20^{\circ} \mathrm{C}$

Product Description : pETBK is a medium copy number, kanamycin resistant, T7 bacterial expression vector. The T7 expression system is one of the strongest expression systems and has been widely used with a coupling of BL21 (DE3) E. coli strain. T7 RNA polymerase gene is integrated in a genome of BL21(DE3) under control of lacUV5 promoter. Upon addition of isopropyl-1-thio- $\beta$-D-galactopyranoside (IPTG), T7 RNA polymerase is expressed in the BL21(DE3) cells harboring pETBK vector, and it induces a high-level protein expression from T7 promoter of pETBK. BioDynamics Laboratory Inc. offers several kinds of T7 bacterial expression vectors. Among them, pETBK is standard kanamycinresistant vector for a high level expression of proteins.

| T7 promoter : | $171-187$ |
| :--- | :--- |
| T7 transcription start : | 188 |
| His Tag : | $263-280$ |
| T7 terminator : | $456-503$ |
| pMB1 ori : | $1660-2279$ |
| Km : | $703-1518$ |

## Features of T7 expression vectors

BioDynamics Laboratory Inc. provides 6 kinds of T7 expression vectors, pETUA, pETBA, pETIA, pETUK, pETBK, and pETIK. These vectors have the same multicloning site and specific feature of each vector is below:

|  | Plasmid copy <br> number | Replicon | Antibiotic <br> resistance | Feature and recommendation |
| :--- | :---: | :---: | :--- | :--- |
| pETUA | high copy | pUC | ampicillin | for non-toxic protein expression |
| pETBA | medium copy | pMB1 | ampicillin | general expression |
| pETIA | medium copy | pMB1 | ampicillin | stringent regulation with lac repressor |
| pETUK | high copy | pUC | kanamycin | for non-toxic protein expression |
| pETBK | medium copy | pMB1 | kanamycin | general expression |
| pETIK | medium copy | pMB1 | kanamycin | stringent regulation with lac repressor |

## PRODUCT INFORMATION

## PRODUCT USAGE

## Cloning of a gene to pETBK:

Below is the multiple cloning site of pETBK. To express a recombinant protein correctly, it is necessary to clone the gene of interest in frame with an N-terminal peptide of pETBK. The start codon of pETBK is boxed ATG in the below figure. Digest pETBK completely with appropriate restriction enzyme(s) to form DNA ends which can be ligated to the gene of interest. If only one restriction enzyme is used, dephosphorylation of a vector is often performed. Ligation of processed pETBK and the gene of interest can be performed by the standard procedure. The following transformation procedure should be done with non-expression hosts such as DH5 $\alpha$ or JM109. In the transformation, recombinant cells should be selected on LB agar plates containing $15-25 \mu \mathrm{~g} / \mathrm{ml}$ of kanamycin., because higher concentration of kanamycin often retarded cell growth on the agar plates. Recombinant plasmids derived from pETBK are selected by colony-PCR, enzyme digestion of prepared plasmids, or other methods. Sequencing of cloning portion and an insert region on the obtained plasmid is recommended to determine the correct recombinant plasmids for expression experiments.

T7 promoter XbaI

EK: Enterokinase recognition sequence (AspAspAspAspLys $\downarrow$ )
ATG: start codon TAA : stop codon

## PRODUCT INFORMATION

## Protein Expression Procedure :

The following protocol is a general guide for the protein expression by using T 7 expression vectors, pETUA, pETBA, pETIA, pETUK, pETBK, and pETIK, coupling with an expression host E. coli cell, BL21(DE3) cells or BL21(DE3)pLysS cells.

- Before starting:

Transform BL21(DE3) or BL21(DE3)pLysS cells with the prepared expression plasmid by the standard procedure. If kanamycin is used for selection, recombinant cells should be selected on LB agar plates containing $15-25 \mu \mathrm{~g} / \mathrm{ml}$ of kanamycin, because a higher concentration of kanamycin often retards cell growth on the agar plates.

## $\ddagger$ Notes for transformation

1. Sometimes, expression may vary among transformants. If large and small colonies are observed in the same plate, the expressed protein may affect the growth of the E. coli cells.
2. If the expressed protein is toxic to $E$. coli cells, transformants may not be obtained.

In this case, repression of a basal level expression by T7 promoter may work, see "Notes for expression."

- Expression:

1. Following transformation, pick a colony and inoculate it into 3 ml of LB medium containing the appropriate antibiotic (kanamycin is often used at $25-30 \mu \mathrm{~g} / \mathrm{ml}$ for liquid culture) with shaking at $37^{\circ} \mathrm{C}$, overnight. For the BL21(DE3)pLysS strain, it is preferable to add chloramphenicol at a final concentration of $34 \mu \mathrm{~g} / \mathrm{ml}$ in the overnight culture to maintain pLysS.
2. The next morning, transfer 0.5 ml of the overnight culture to a new 10 ml of LB medium containing the appropriate antibiotic to select the expression plasmid. Grow the culture with shaking at $37^{\circ} \mathrm{C}$ until the $\mathrm{OD}_{600}$ reaches 0.5 (approximately 2 hrs but this depended on the expression plasmids).

When using BL21(DE3)pLys, chloramphenicol is not usually required in the short-period culture.
3. When the $\mathrm{OD}_{600}$ reaches 0.5 , transfer an aliquot (e.g., 1 ml ) of the culture to a new centrifuge tube and centrifuge it to harvest cells. Store the cells at $-80^{\circ} \mathrm{C}$ until analysis.
Add IPTG to a final concentration of 1 mM to the rest of the culture and grow the culture with shaking at $37^{\circ} \mathrm{C}$ for 3 hours.
The IPTG concentration and induction time are general values. It is recommended to determine the optimal condition for the target gene expression.
4. After the induction, harvest the cells. To analyze the expression, before harvesting the cells, transfer an aliquot of the culture (e.g., 1 ml ) and centrifuge it to precipitate the cells.

## - Analysis

1. Suspend the precipitated cells (from the 1 ml culture) in $200 \mu \mathrm{l}$ of $1 \times$ PBS buffer.
2. Mix an aliquot of the suspension (e.g., $100 \mu \mathrm{l}$ ) with an equal volume of $2 \times$ SDS sample buffer.
3. Heat the mixture at $85^{\circ} \mathrm{C}$ for 5 min , then centrifuge at $10,000 \mathrm{~g}$ for 10 min . Subject the supernatant (e.g., $5-25 \mu \mathrm{l}$ ) to SDS-PAGE. Western blot will help analyzing the expression of the target protein.
$\cdot 2 \times$ SDS sample buffer : $2 \%$ sodium dodecyl sulfate, $5 \% 2$-mercaptoethanol, $20 \%$ glycerol, 0.02 \% BPB, 62.5 mM Tris- $\mathrm{HCl}, \mathrm{pH} 6.8$

- $1 \times$ PBS buffer.: 20 mM sodium phosphate, 150 mM sodium chloride, pH 7.4

## BioDynamics Laboratory Inc.

An arrow shows the expressed 65 KDa proteins.

Figure of protein expression from pETBK
A gene of 65 KDa protein was cloned into pETBK (pETBK/65K). BL21(DE3) cell was transformed with the pETBK/65K, six colonies were picked and followed the "Protein Expression Procedure" as above. After induction, aliquot of the cells from each culture was subjected to $10 \%$ polyacrylamide gel SDS electrophoresis. The gel was stained with Quick Blue Protein Staining Solution (BioDynamics Laboratory Inc. \#DS500).
Lane 1: DynaMarker Protein Eco ( \#DM610)
Lane 2 : BL21(DE3) harboring pETBK but not pETBK/65K
Lane 3-8 : BL21(DE3) cells, clones 1-6

## $\ddagger$ Notes for expression:

1. As the T7 expression method is a high-level protein expression system, some basal level expression of the target protein will occur in uninduced cells. This is likely problematic in cases in which the target protein is toxic to $E$. coli. cells. In this case, it may be necessary to decrease the basal level expression as follows:
a) Use a lower-copy number T7 expression vector, pETBA, pETBK, but not pETUA, pETUK
b) Use a stringent regulated expression vector, pETIA, pETIK.
c) Use liquid medium and agar plates supplemented with glucose (0.5-1 \%).

Glucose is known to decrease a basal expression from lacUV5 promoter ${ }^{2}$.
d) Use BL21(DE3)pLysS strain but not BL21(DE3) strain.

The T7 Lysozyme encoded in a pLysS plasmid reduces the basal level of T7 RNA polymerase Expression ${ }^{3)}$. This leads to suppression of the basal level expression of the target protein.
2. When expressing proteins in BL21(DE3) cells, if it takes a longer time ( 5 hrs or more) to reach 0.5 at $\mathrm{OD}_{600}$ after inoculating the overnight culture $(0.5 \mathrm{ml})$ to a new LB medium $(10 \mathrm{ml})$, the expressed protein is likely toxic to E. coli cells.
3. When BL21(DE3) cells lyse after induction with IPTG, the expressed protein is likely toxic to E. coli cells.
