HAMSTER PHOSPHOLIPID B-LIKE 2 (PLBL2)

Immunoperoxidase Assay for Determination of PLBL2 in cultures derived from CHO Cells

DIRECTIONS FOR USE

Version3 L52 - 6

For Research Use Only, NOT for Diagnostic Purposes

Please Read this Package Insert Completely Before Using This Product

For Reference Only

INTENDED USE

The Hamster Phospholipid B-Like 2 (PLBL2) test kit is a highly sensitive two-site enzyme linked immunoassay (ELISA) for measuring PLBL2 as a host cell impurity protein in cultures derived from Chinese hamster ovary cells.

PRINCIPLE OF THE ASSAY

The principle of the double antibody sandwich ELISA is represented in Figure 1. In this assay the PLBL2 present in samples reacts with the anti-PLBL2 antibodies which have been adsorbed to the surface of polystyrene microtitre wells. After the removal of unbound proteins by washing, the Detection Antibody, biotin conjugated anti-PLBL2 is added and complexes are formed. Following a wash step, the horseradish peroxidase (HRP) conjugated Streptavidin is added and complexes are formed. Following another washing step, the complexes are assayed by the addition of a chromogenic substrate, 3,3',5,5'-tetramethylbenzidine (TMB). The quantity of bound enzyme varies directly with the concentration of PLBL2 in the sample tested; thus, the absorbance, at 450 nm, is a measure of the concentration of PLBL2 in the test sample. The quantity of PLBL2 in the test sample can be interpolated from the standard curve constructed from the standards, and corrected for sample dilution.

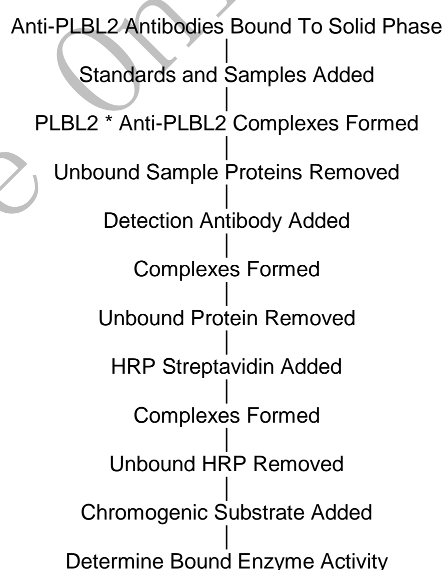

Figure 1.

REAGENTS (Quantities sufficient for 96 determinations)

1. DILUENT CONCENTRATE (Running Buffer)
One bottle containing 60 ml of a 1X diluent running buffer.

2. WASH SOLUTION CONCENTRATE
One bottle containing 50 ml of a 20X concentrated wash solution.

3. DETECTION ANTIBODY 100X
One vial containing 150 µL of affinity purified anti-PLBL2 antibody conjugated with biotin in a stabilizing buffer.

4. HRP-STREPTAVIDIN 100X
One vial containing 150 µL of HRP conjugated streptavidin in a stabilizing buffer.

5. CHROMOGEN-SUBSTRATE SOLUTION
One vial containing 12 mL of 3,3',5,5'-tetramethybenzidine (TMB) and hydrogen peroxide in citric acid buffer at pH 3.3.

6. STOP SOLUTION
One vial containing 12 ml 0.3 M sulfuric acid.

WARNING: Avoid contact with skin.

7. ANTI-PLBL2 ELISA MICRO PLATE
Twelve removable eight (8) well micro well strips in well holder frame. Each well is coated with affinity purified anti-PLBL2.

8. PLBL2 CALIBRATOR
One vial containing a lyophilized PLBL2 calibrator.

FOR IN VITRO USE ONLY

REAGENT PREPARATION

1. DILUENT CONCENTRATE
Ready to use as supplied.

2. WASH SOLUTION CONCENTRATE
The Wash Solution supplied is a 20X Concentrate and must be diluted 1/20 with distilled or deionized water (1 part buffer concentrate, 19 parts dH2O). Crystal formation in the concentrate is not uncommon when storage temperatures are low. Warming of the concentrate to 30-35°C before dilution can dissolve crystals.

3. DETECTION ANTIBODY 100X
Calculate the required amount of working conjugate solution for each microtitre plate test strip by adding 10 µL detection antibody to 990 µL of 1X Diluent for each test strip to be used for testing. Mix uniformly, but gently. Avoid foaming.

4. HRP-STREPTAVIDIN 100X
Calculate the required amount of working conjugate solution for each microtitre plate test strip by adding 10 µL HPR-streptavidin to 990 µL of 1X Diluent for each test strip to be used for testing. Mix uniformly, but gently. Avoid foaming.

5. CHROMOGEN-SUBSTRATE SOLUTION
Ready to use as supplied.

6. STOP SOLUTION
Ready to use as supplied.

7. ANTI-PLBL2 ELISA MICRO PLATE
Ready to use as supplied. Unseal Microtiter Pouch and remove plate from pouch. Remove all strips and wells that will not be used in the assay and place back in pouch and re-seal along with desiccant.

8. PLBL2 CALIBRATOR
Add 1.0 ml of distilled or de-ionized water to the PLBL2 Calibrator and mix gently until dissolved. The calibrator is now at a concentration of 53.33 ng/ml (**the reconstituted calibrator should be aliquoted and frozen if future use is intended.** PLBL2 standards need to be prepared immediately prior to use (see chart below). Mix well between each step. Avoid foaming.

Standard	ng/ml	Volume added to 1x Diluent →	Volume of 1x Diluent
7	20	300 µl PLBL2 Calibrator	500 µl
6	10	300 µl standard 7	300 µl
5	5	300 µl standard 6	300 µl
4	2.50	300 µl standard 5	300 µl
3	1.25	300 µl standard 4	300 µl
2	0.63	300 µl standard 3	300 µl
1	0.31	300 µl standard 2	300 µl
0	0		600 µl

STORAGE AND STABILITY

The expiration date for the kit is stated on the box label.

1. DILUENT
The 1X Diluent is stable until the expiration date and should be stored at 4-8°C.

2. WASH SOLUTION
The 20X Wash Solution Concentrate is stable until the expiration date. The 1X working solution is stable for at least one week from the date of preparation. Both solutions can be stored at room temperature (16-25°C) or at 4-8°C.

3. DETECTION ANTIBODY 100X
Undiluted Biotin conjugated anti-PLBL2 should be stored at 4-8°C and **diluted immediately prior to use**. The working conjugate solution is stable for up to 1 hour when stored in the dark.

4. HRP-STREPTAVIDIN 100X
Undiluted horseradish peroxidase conjugated streptavidin should be stored at 4-8°C and **diluted immediately prior to use**. The working conjugate solution is stable for up to 1 hour when stored in the dark.

For Reference Only

5. CHROMOGEN-SUBSTRATE SOLUTION
The Substrate Solution should be stored at 4-8°C and is stable until the expiration date.

6. STOP SOLUTION
The Stop Solution should be stored at 4-8°C and is stable until the expiration date.

7. ANTI-PLBL2 ELISA MICRO PLATE
Anti-PLBL2 coated wells are stable until the expiration date, and should be stored at 4-8°C in sealed foil pouch with desiccant pack.

8. PLBL2 CALIBRATOR
The lyophilized PLBL2 calibrator should be stored at 4C or frozen until reconstituted. The reconstituted calibrator should be aliquoted out and stored frozen (avoid multiple freeze-thaw cycles). The working standard solutions should be prepared immediately prior to use.

INDICATIONS OF INSTABILITY
If the test is performing correctly, the results observed with the standard solutions should be within 20 % of the expected values.

SPECIMEN COLLECTION AND HANDLING

Blood should be collected by venipuncture. The serum should be separated from the cells after clot formation by centrifugation. For plasma samples, blood should be collected into a container with an anticoagulant and then centrifuged. Care should be taken to minimize hemolysis, excessive hemolysis can impact your results. Assay immediately or aliquot and store samples at -20°C. Avoid repeated freeze-thaw cycles.

1. Precautions

For any sample that might contain pathogens, care must be taken to prevent contact with open wounds.

2. Additives and Preservatives

No additives or preservatives are necessary to maintain the integrity of the specimen. Avoid azide contamination.

3. Known interfering substances

Azide and thimerosal at concentrations higher than 0.1% inhibits the enzyme reaction.

MATERIAL PROVIDED
See "REAGENTS"

MATERIALS REQUIRED
BUT NOT PROVIDED

- Precision pipette (2 µL to 200 µL) for making and dispensing dilutions
- Test tubes
- Microtitre washer/aspirator
- Distilled or Deionized H_2O
- Microtitre Plate reader
- Assorted glassware for the preparation of reagents and buffer solutions
- Timer
- Orbital Shaker

ASSAY PROTOCOL

DILUTION OF SAMPLES

The assay for quantification of PLBL2 in samples requires that each test sample be diluted before use. For a single step determination a dilution at 1/20 is appropriate for some CHO culture extract samples. For absolute quantification, samples that yield results outside the range of the standard curve, a lesser or greater dilution might be required. **If unsure of sample level, a serial dilution with one or two representative samples before running the entire plate is highly recommended.**

1. To prepare a 1/20 dilution of a sample, transfer 15 µl of sample to 285 µl of 1X diluent. This gives you a 1/20 dilution of your sample. Mix thoroughly.

PROCEDURE

1. **Bring all reagents to room temperature before use.**

2. Pipette 100 µL of
    Standard 0 (0.0 ng/ml) in duplicate
    Standard 1 (0.31 ng/ml) in duplicate
    Standard 2 (0.63 ng/ml) in duplicate
    Standard 3 (1.25 ng/ml) in duplicate
    Standard 4 (2.50 ng/ml) in duplicate
    Standard 5 (5 ng/ml) in duplicate
    Standard 6 (10 ng/ml) in duplicate
    Standard 7 (20 ng/ml) in duplicate

3. Pipette 100 µL of sample (in duplicate) into pre designated wells.

4. Incubate the micro titer plate for 120 minutes (120 ± 2) while shaking on an orbital shaker at 400 rpm, at room temperature. Keep plate covered and level during incubation.

For Reference Only

5. Following incubation, aspirate the contents of the wells.

6. Completely fill each well with appropriately diluted Wash Solution and aspirate. Repeat three times, for a total of four washes. If washing manually: completely fill wells with wash buffer, invert the plate then pour/shake out the contents in a waste container. Follow this by sharply striking the wells on absorbent paper to remove residual buffer. Repeat 3 times for a total of four washes.

7. Pipette 100 μL of appropriately diluted detection antibody into each well. Incubate the micro titer plate at room temperature for twenty (20 ± 2) minutes while shaking on an orbital shaker at 400 rpm. Keep plate covered in the dark and level during incubation.

8. Wash and blot the wells as described in Steps 5/6.

9. Pipette 100 μL of appropriately diluted HRP-streptavidin into each well. Incubate the micro titer plate at room temperature for twenty (20 ± 2) minutes while shaking on an orbital shaker at 400 rpm. Keep plate covered in the dark and level during incubation.

10. Wash and blot the wells as described in Steps 5/6.

9. Pipette 100 μL of TMB Substrate Solution into each well.

10. Incubate in the dark at room temperature for precisely ten (10) minutes while shaking on an orbital shaker at 400 rpm.

11. After ten minutes, add 100 μL of Stop Solution to each well.

12. Determine the absorbance (450 nm) of the contents of each well. Calibrate the plate reader to manufacture's specifications.

STABILITY OF THE FINAL REACTION MIXTURE

The absorbance of the final reaction mixture can be measured up to 30 minutes after the addition of the Stop Solution. However, good laboratory practice dictates that the measurement be made as soon as possible.

RESULTS

1. Subtract the average background value from the test values for each sample.

2. Using the results observed for the standards construct a Standard Curve. The appropriate curve fit is that of a four-parameter logistics curve. A second order polynomial (quadratic) or other curve fits may also be used.

3. Interpolate test sample values from standard curve. Correct for dilution factor to arrive at the PLBL2 concentration in original samples.

LIMITATION OF THE PROCEDURE

1. Reliable and reproducible results will be obtained when the assay procedure is carried out with a complete understanding of the information contained in the package insert instructions and with adherence to good laboratory practice.

2. Factors that might affect the performance of the assay include proper instrument function, cleanliness of glassware, quality of distilled or deionized water, and accuracy of reagent and sample pipettings, washing technique, incubation time or temperature.

3. Do not mix or substitute reagents with those from other lots or sources.
