

## Mouse Anti-Monkey IgG Monoclonal Antibody, R-PE Conjugated

### Mouse, Monoclonal (IgG)

Cat. No. DMAB4764

Lot. No. (See product label)

#### PRODUCT INFORMATION

**Product Overview:** Mab to IgG; Mouse Monoclonal Antibody to Monkey Immunoglobulin G heavy chain

**Clone:** TB109a

**Ig Isotype:** Mouse IgG1

**Immunogen:** Rhesus IgG

**Format:** R-phycoerythrin (R-PE) Conjugate

**Quality:** 0.1 mg

**Specificity:** Rhesus and Cynomolgous Monkey IgG heavy chain as demonstrated by ELISA

**Applications:** Enzyme-Linked-Immunosorbent-Assay (ELISA); Fluorescent-Linked-Immunosorbent-Assay (FLISA)

**Characterization:** To ensure lot to lot consistency, each batch of product is tested by ELISA/FLISA to conform to the characteristics of a standard reference reagent.

**Working Dilutions:** FLISA: PE conjugate 0.1ug; Other Applications: Since applications vary, you should determine the optimum working dilution of the product that is appropriate for your specific need.

**Handling And Storage:** The R-phycoerythrin (R-PE) conjugate is supplied as 0.1 mg in 0.2mL of PBS/NaN<sub>3</sub> and a stabilizing agent. Store at 2-8°C. Do not freeze!

**Warning:** Reagents contain sodium azide which is very toxic if ingested or inhaled. Avoid contact with skin, eyes, or clothing. Wear eye or face protection when handling. If skin or eye contact occurs, wash with copious amounts of water. If ingested or inhaled, contact a physician immediately. Sodium azide yields toxic hydrazoic acid under acidic conditions. Dilute azide-containing compounds in running water before discarding to avoid accumulation of potentially explosive deposits in lead or copper plumbing.

#### BACKGROUND

**Introduction:** Immunoglobulin G (IgG) are antibody molecules. Each IgG is composed of four peptide chains -two heavy chains and two light chains. Each IgG has two antigen binding sites. Other Immunoglobulins may be described in terms of polymers with the IgG structure considered the monomer. IgG molecules are synthesized and secreted by plasma B cells. IgG antibodies are large molecules of about 150 kDa composed of 4 peptide chains. It contains 2 identical heavy chains of about 50 kDa and 2 identical light chains of about 25 kDa, thus a tetrameric quaternary structure. The two heavy chains are linked to each other and to a light chain each by disulfide bonds. The resulting tetramer has two identical halves, which together form the Y-like shape. Each end of the fork contains an identical antigen binding site. The Fc regions of IgGs bear a highly conserved N-glycosylation site. The N-glycans attached to this site are predominantly core-fucosylated diantennary structures of the complex type. In addition, small amounts of these N-glycans also bear bisecting GlcNAc and  $\alpha$ -2,6-linked sialic acid residues.

**Keywords:** Ig gamma 1 chain C region;IGHG1; Immunoglobulin heavy constant gamma 1; Immunoglobulin G; IgG; Immunoglobulin G heavy chain; IgG heavy chain
