CUSTOM CELL LINE SERVICES AVAILABLE UP TO 3 KNOCK-INS IN A SINGLE CELL LINE

HISTONE H3.3

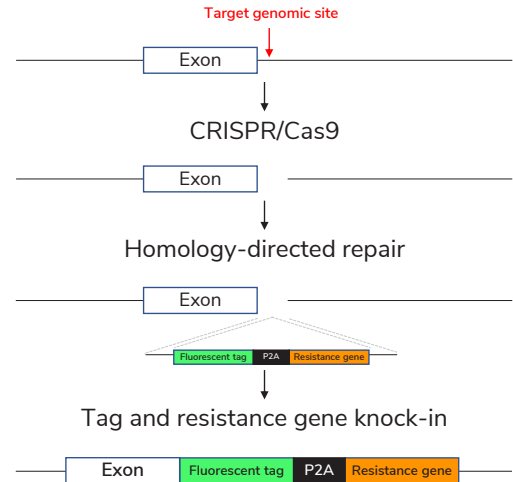

Gene-tagged cell line (HEK 293T)

Catalog no: EXP-005

ExpressCells' FAST-HDR knock-in technology

ExpressCells uses CRISPR and FAST-HDR vector technology to knock-in fluorescent, luminescent, or other tags at the C-terminus of endogenous genes. The non-viral FAST-HDR system enables rapid labeling of up to three proteins of interest in a single mammalian cell line.

| | |
|-----------------------------|-------------------|
| Cell type: | HEK 293T |
| Gene symbol: | H3F3B |
| NCBI gene ID: | 3021 |
| Protein: | Histone H3.3 |
| Subcellular location: | Nucleus |
| Modification: | C-terminal mRuby3 |
| Excitation / Emission (nm): | 558 / 592 |
| Antibiotic resistance: | Zeocin™ |
| Population type: | Heterozygous |

Handling

Culture medium: Dulbecco's Modified Eagle Medium (DMEM), high glucose supplemented with 10% fetal bovine serum (FBS) and penicillin/streptomycin to prevent bacterial contamination.

Thawing: Transfer the frozen tube to a 37° C water bath and let contents thaw. Transfer tube contents to 10 mL of prewarmed medium in a biosafety hood and centrifuge at 200 × g for 5 min. Resuspend the pellet in 5 mL of medium and transfer to a mammalian cell culture flask.

Safety: Biosafety level 2.

Protein summary from NCBI database

Histones are basic nuclear proteins that are responsible for the nucleosome structure of the chromosomal fiber in eukaryotes. Two molecules of each of the four core histones (H2A, H2B, H3, and H4) form an octamer, around which approximately 146 bp of DNA is wrapped in repeating units, called nucleosomes....
