

11-204-C025

Monoclonal Antibody to CD5 Purified Antibody (0.025 mg)

Clone: MEM-32

Isotype: Mouse IgG1

Specificity: The antibody MEM-32 reacts with the cell surface glycoprotein CD5, a 67kDa

single-chain transmembrane glycoprotein expressed on mature T-lymphocytes,

most of thymocytes and B-lymphocytes subset (B-1a lymphocytes).

HLDA III; WS Code T 523

Regulatory Status: RUO

Immunogen: Crude thymus membrane fraction.

Species Reactivity: Human

Application: Flow Cytometry

Recommended dilution: 2 µg/ml

Immunoprecipitation Western Blotting

Application note: Non-reducing conditions. Immunohistochemistry (paraffin sections)

Recommended dilution: 20 µg/ml

Positive tissue: spleen

ELISA

The antibody MEM-32 can be used in the Sandwich ELISA as the capture antibody

in pair with the detection antibody CRIS1

Purity: > 95% (by SDS-PAGE)

Purification: Purified by protein-A affinity chromatography

Concentration: 1 mg/ml

Storage Buffer: Phosphate buffered saline (PBS) with 15 mM sodium azide, approx. pH 7.4

Storage / Stability: Store at 2-8°C. Do not freeze. Do not use after expiration date stamped on vial

label.

Expiration: See vial label

Lot Number: See vial label

PRODUCT DATA SHEET

Background:

CD5 antigen (T1; 67 kDa) is a human cell surface T-lymphocyte single-chain transmembrane glycoprotein. CD5 is expressed on all mature T-lymphocytes, most of thymocytes, subset of B-lymphocytes and on many T-cell leukemias and lymphomas. It is a type I membrane glycoprotein whose extracellular region contains three scavenger receptor cysteine-rich (SRCR) domains.

The CD5 is a signal transducing molecule whose cytoplasmic tail is devoid of any intrinsic catalytic activity. CD5 modulates signaling through the antigen-specific receptor complex (TCR and BCR). CD5 crosslinking induces extracellular Ca++ mobilization, tyrosine phosphorylation of intracellular proteins and DAG production. Preliminary evidence shows protein associations with ZAP-70, p56lck, p59fyn, PC-PLC, etc. CD5 may serve as a dual receptor, giving either stimulatory or inhibitory signals depending both on the cell type and development stage. In thymocytes and B1a cells seems to provide inhibitory signals, in peripheral mature T lymhocytes it acts as a costimulatory signal receptor. CD5 is the phenotypic marker of a B cell subpopulation involved in the production of autoreactive antibodies.

Disease relevance: CD5 is a phenotypic marker for some B cell lymphoproliferative disorders (B-CLL, Hairy cell leukemia, etc.). The CD5+ popuation is expanded in some autoimmune disorders (Rheumatoid Arthritis, etc.). Herpes virus infections induce loss of CD5 expression in the expanded CD8+ human T cells.
