

11-643-C100

Monoclonal Antibody to CD361 Purified Antibody (0.1 mg)

Clone: MEM-216
Isotype: Mouse IgG1

Specificity: The mouse monoclonal antibody MEM-216 recognizes CD361 / EVI2B, almost

uncharacterized type I transmembrane protein with broad leukocyte expression,

mostly in myeloid and B cells. HLDA IX.; WS Code 263

Regulatory Status: RUO

Immunogen:

Raji cells

Species Reactivity: Human

Application: Flow Cytometry

Positive control:Raji, Daudi, HL-60 cells, peripheral blood lymphcocytes (strongly

positive on CD19+ cells)

Negative control:Jurkat, U-937 cells

Immunoprecipitation

Purity: > 95% (by SDS-PAGE)

Purification: Purified by protein-A affinity chromatography

Concentration: 1 mg/ml

Storage Buffer: Phosphate buffered saline (PBS) with 15 mM sodium azide, approx. pH 7.4

Storage / Stability: Store at 2-8°C. Do not freeze. Do not use after expiration date stamped on vial

label.

Expiration: See vial label

Lot Number: See vial label

Background: CD361, also known as EVI2B (Ecotropic Viral Integration site 2B) or EVDB, is a

poorly characterized type I transmembrane protein, expressed from one of three genes embedded in intron 27b of the neurofibromatosis type 1 (NF1) gene. The DNA strand that is transcribed to produce CD361 is the complementary one to the strand encoding NF1. Murine homolog to human CD361 is associated with ecotropic viral insertions, which have been implicated in the expression of murine myeloid leukemias. CD361 has been also reported to be involved in melanocyte and keratinocyte differentiation. However, it is expressed mainly in peripheral blood

and bone marrow.
