

PRODUCT DATA SHEET

N-omega-CD₃-Octadecanoyl-phytosphingosine

Catalog number: 2210

Synonyms: N-C18:0-CD₃-Phytoceramide; N-Stearoyl-CD₃-phytosphingosine

Source: semisynthetic, yeast (*Pichia ciferri*)

Solubility: chloroform, DMF, DMSO

CAS number: N/A

Molecular Formula: C₃₆H₇₀D₃NO₄

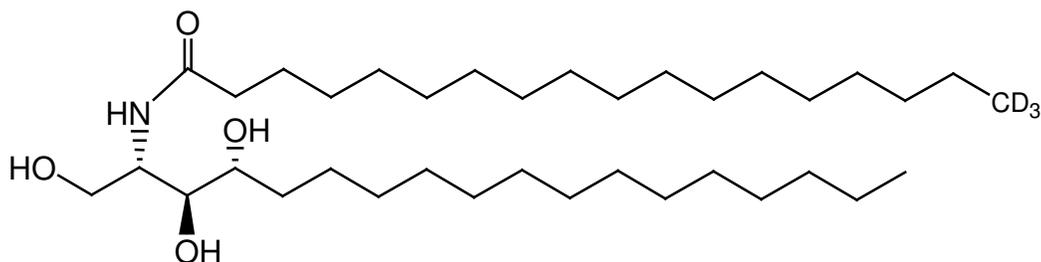

Molecular Weight: 587

Storage: -20°C

Purity: TLC, HPLC >98%; identity confirmed by MS

TLC System: chloroform/methanol (90:10)

Appearance: solid

Application Notes:

This product is a well-defined ceramide containing a deuterated stearic acid acylated to the sphingosine base making it an ideal stable isotope-labeled standard for lipidomic studies using mass spectrometry. Stable isotope-labeled tracers are ideal for studies involving the metabolism and various metabolites of a lipid and can be used for the quantitative evaluation of major lipid pathways.¹ Lipidomics has shown great success in the use of deuterium labeled compounds in identifying and quantifying individual molecular species by the use of tandem mass spectrometry.²

Phytosphingosine is a long-chain sphingoid base having important cellular functions such as signaling, cytoskeletal structure, cellular cycle, and heat stress response. It is found largely in mammals, plants, and yeast. Phytosphingosine has seen much use in cosmetics due to its effects on the skin such as reducing inflammation by inhibiting the expression of the allergic cytokines IL-4 and TNF- α and the activation of the transcription factors NF- κ B and c-jun in histamine-stimulated skin tissues.³ Phytosphingosine can lead to apoptosis via two distinct pathways and has been investigated as a possible cancer therapeutic treatment.⁴ Phytoceramides (fatty acid acylated to Phytosphingosine) are distributed at the microvillous membrane of the epithelial cells of the small intestine. Crypt cells and the adjacent epithelial cells produce phytosphingoglycolipids in much greater quantities than more differentiated epithelial cells.⁵ The kidney and skin also contain phytosphingoglycolipids although in much lower concentrations than in the small intestine. Phytoceramides form part of the water barrier lipids of the skin.
