BACKGROUND

Mouse LMIR3, also known as CLM-1, IgSF13, IREM-1 and CMRF35-like molecule 1, and designated CD300f, is a 55 kDa type I transmembrane (TM) glycoprotein. It is synthesized as a 283 amino acid (aa) precursor that contains a putative 19 aa signal sequence, a 175 aa extracellular region that contains one Ig-like domain, a 17 aa TM segment and a 72 aa cytoplasmic domain that contains an ITIM sequence. There are multiple alleles for this gene that vary considerably in size. Mouse LMIR3 is expressed in monocytic cell lines. Mature mouse LMIR3 extracellular region shares 43% and 72% aa identity with human and rat LMIR3 extracellular region, respectively.
