

# Mouse IFN-γ PE-conjugated Antibody

Monoclonal Rat IgG<sub>2A</sub> Clone # 37895 Catalog Number: IC485P

Catalog Number: IC485P 100 Tests, 25 Tests

DESCRIPTION			
Species Reactivity	Mouse		
Specificity	Detects mouse IFN-γ in Western blots. In Western blots, this antibody does not cross-react with recombinant human (rh) IFN-γ, rrIFN-γ, rpIFN-γ, rrmIFN-γ, rfeIFN-γ, or rcaIFN-γ.		
Source	Monoclonal Rat IgG <sub>2A</sub> Clone # 37895		
Purification	Protein A or G purified from hybridoma culture supernatant		
Immunogen	E. coli-derived recombinant mouse IFN-y		
Conjugate	Phycoerythrin Excitation Wavelength: 488 nm Emission Wavelength: 565-605 nm		
Formulation	Supplied in a saline solution containing BSA and Sodium Azide. See Certificate of Analysis for details.		
	*Contains <0.1% Sodium Azide, which is not hazardous at this concentration according to GHS classifications. Refer to the Safety Data Sheet (SDS) for additional information and handling instructions.		

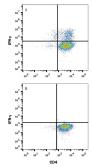

### **APPLICATIONS**

Please Note: Optimal dilutions should be determined by each laboratory for each application. General Protocols are available in the Technical Information section on our website.

	Recommended Concentration	Sample
Intracellular Staining by Flow Cytometry	10 μL/10 <sup>6</sup> cells	See Below

### Data

## Intracellular Staining by Flow Cytometry

Detection of IFN-y in Mouse Splenocytes Stimulated to Induce Th1 cells by Flow Cytometry. Mouse splenocytes either (A) stimulated to induce Th1 cells or (B) unstimulated were stained with Rat Anti-Mouse IFN-y PE-conjugated Monoclonal Antibody (Catalog # IC485P) and Rat Anti-Mouse CD4 APC-conjugated Monoclonal Antibody (Catalog # FAB554A). Quadrant markers were set based on control antibody staining (Catalog # IC006P). To facilitate intracellular staining, cells were fixed with Flow Cytometry Fixation Buffer (Catalog # FC004) and permeabilized with Flow Cytometry Permeabilization/Wash Buffer I (Catalog # FC005). View our protocol for Staining Intracellular Molecules.

# PREPARATION AND STORAGE

Shipping The product is shipped with polar packs. Upon receipt, store it immediately at the temperature recommended below.

Stability & Storage

Protect from light. Do not freeze.

12 months from date of receipt, 2 to 8 °C as supplied.

Rev. 2/7/2018 Page 1 of 2

# Mouse IFN-γ PE-conjugated Antibody

Monoclonal Rat  $IgG_{2A}$  Clone # 37895

Catalog Number: IC485P 100 Tests, 25 Tests

### BACKGROUND

Interferon-gamma (IFN-γ), also known as Type II or Immune Interferon, exerts a wide range of immunoregulatory activities and is considered to be the prototype proinflammatory cytokine (1, 2). Mature mouse IFN-γ exists as a noncovalently linked homodimer of 20-25 kDa variably glycosylated subunits (3). It shares 86% amino acid sequence identity with rat IFN-γ and 38-44% with bovine, canine, cotton rat, equine, feline, human, porcine, and rhesus macaque IFN-γ. IFN-γ dimers bind to IFN-γ RI (alpha subunits) which then interact with IFN-γ RII (beta subunits) to form the functional receptor complex of two α and two β subunits. Inclusion of IFN-γ RII increases the binding affinity for ligand and the efficiency of signal transduction (4, 5). IFN-γ is produced by a variety of immune cells under inflammatory conditions, notably by T cells and NK cells (6). It plays a key role in host defense by promoting the development and activation of Th1 cells, chemoattraction and activation of monocytes and macrophages, upregulation of antigen presentation molecules, and immunoglobulin class switching in B cells. It also exhibits anti-viral, anti-proliferative, and apoptotic effects (6, 7). In addition, IFN-γ functions as an anti-inflammatory mediator by promoting the development of regulatory T cells and inhibiting Th17 cell differentiation (8, 9). The pleiotropic effects of IFN-γ contribute to the development of multiple aspects of atherosclerosis (7).
