Swine H1N1 Hemagglutinin Antibody

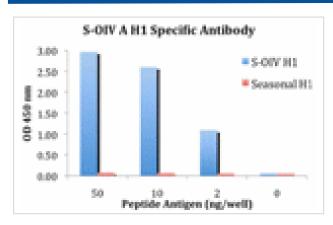

Catalog No: #24922

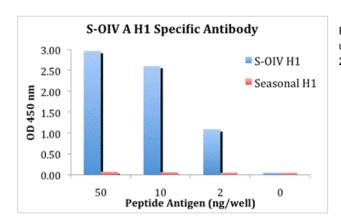

Orders: order@signalwayantibody.com Support: tech@signal way antibody.com

Product Name Swine H1N1 Hemagglutinin Antibody Host Species Rabbit Clonality Polyclonal Purification Affinity chromatography purified via peptide column Applications E Species Reactivity Virus Specificity This antibody is specific for the novel swine influenza Hemagglutinin and will not recognize the Hemagglutinin sequence from the seasonal H1N1 influenza (A/Brisbane/59/2007 (H1N1)). Wi with peptide corresponding to the seasonal H1N1 Hemagglutinin. Immunogen Type Peptide Immunogen Description Raised against a synthetic peptide from the novel swine influenza Hemagglutinin protein. The sequence is unique from the peptide sequence for product 5237 and 5233. This antibody is a description of the sequence for product 5237 and 5233. This antibody is a description of the sequence for product 5237 and 5233. This antibody is a description of the sequence for product 5237 and 5233. 	cognate pair with
product number 5239.	
Target Name Swine H1N1 Hemagglutinin	
Other Names Swine-Origin Influenza A (H1N1) Hemagglutinin Antibody, Swine-Origin Influenza A (H1N1) H	lemagglutinin,
S-OIV A Hemagglutinin, Swine flu H1, HA	
Accession No. ACQ76314	
Formulation Supplied in PBS containing 0.02% sodium azide.	
Storage Can be stored at -20°C, stable for one year. As with all antibodies care should be taken to avoid	
freeze thaw cycles. Antibodies should not be exposed to prolonged high temperatures.	oid repeated

Background

Influenza A virus is a major public health threat, killing more than 30, 000 people per year in the USA. In early 2009, a novel swine-origin influenza A (H1N1) virus was identified in specimens obtained from patients in Mexico and the United States. The virus spread quickly around the world and on June 11, 2009, the World Health Organization declared it a pandemic. Influenza A virus has one of sixteen possible Hemagglutinin (HA) surface proteins and one of nine possible Neuraminidase (NA) surface proteins. The Hemagglutinin protein facilitates viral attachment while Neuraminidase is involved in viral release. These proteins also elicit immune responses that prevent infection or independently reduce viral replication. The genetic make-up of this swine flu virus is unlike any other: it is an H1N1 strain that combines a triple assortment first identified in 1998 including human, swine, and avian influenza with two new pig H3N2 virus genes from Eurasia, themselves of recent human origin. The distinct antigenic properties of the new swine influenza virus compared with seasonal influenza A (H1N1) virus suggest that human immunity against new swine influenza virus is limited, although the age distribution of reported cases suggests some degree of protection in older age groups.

Note: This product is for in vitro research use only and is not intended for use in humans or animals.
