

### pAcMcs1 Baculovirus Transfer Vector

#### Product Summary

**Cat. No:** STV05  
**Quantity:** 10 µg/20 µl  
**Storage:** Store at -20°C  
**Stability:** Stable for 1 year in appropriate conditions

#### Description:

pAcMcs1, modified from pAcYM1, is a baculovirus transfer vector designed for high level expression of foreign genes under the powerful AcMNPV polyhedrin promoter. The transfer vector is the modified transfer vector and is used to insert the foreign gene in the cloning steps. It has a bacterial origin of replication and an ampicillin resistance gene in pUC8. The polyhedrin gene sequences are deleted and there are both 5' noncoding and 3' noncoding DNA sequences of polyhedrin gene in pAc. The multiple cloning site 1 (mcs1) is used for insertion of the foreign gene and restriction sites, including EcoRV and HindIII, are used to confirm the orientation. The AcMNPV sequences flanking the gene, 2kb and 2kb, in the transfer vectors allow homologous recombination with the viral DNA to insert the expression cassette into the polyhedrin locus. pAc vector is compatible with superBAC derivatives and any baculovirus system that utilizes homologous recombination in sf9 insect cells.
